A tale of two species: Human perception influences outcome of human-wild life interactions

Priyanka M. Dange

Abasaheb Garware college, Pune

Wild animals are increasingly finding themselves near human habitation due to scarcity of natural habitats, high human population density and changing land usage. Thus human-wildlife interactions have arisen. Most of the human-wildlife interactions are studied in the context of conflicts. Very few studies have explored the positive interactions.

Human-perception may influence the outcomes of these interactions. Thus, we studied how human-perception can influence the interactions between human and wildlife by focusing on Indian Peafowl.

Wednesday, Oct 10th 2018

11:30 AM (Tea/Coffee at 11:00 AM)

Seminar Hall, TIFR-H
